

# (Best) Practices on Biodiversity

Challenges, corporate efforts &  
enablers for implementation

RBI Biodiversity Day

-

November 27, 2024

*Dr. Charbel Moussa*

*Partner, KPMG*

# Agenda

- 01** The (economic) importance of biodiversity
- 02** The challenges - The enablers - The successes
- 03** Q&A

# Nature and biodiversity create ecosystem services which are fundamental to our modern-day economy

# Biodiversity is "the next elephant around the corner"; it is time to deal with it

01

The dramatic loss of biodiversity is a **global threat** that **has not yet** reached the full extent of the **public debate** - scientists refer to it as the "**twin crisis**" together with climate change

02

It is only **a matter of time** before biodiversity becomes **significantly more important** in the social and political debate

03

Experience with the climate in recent years has shown how **quickly** the requirements for corporates can become **more specific** and **significantly stricter** - the "**regulators**" are clearly signaling that they are already in the **starting blocks**

04

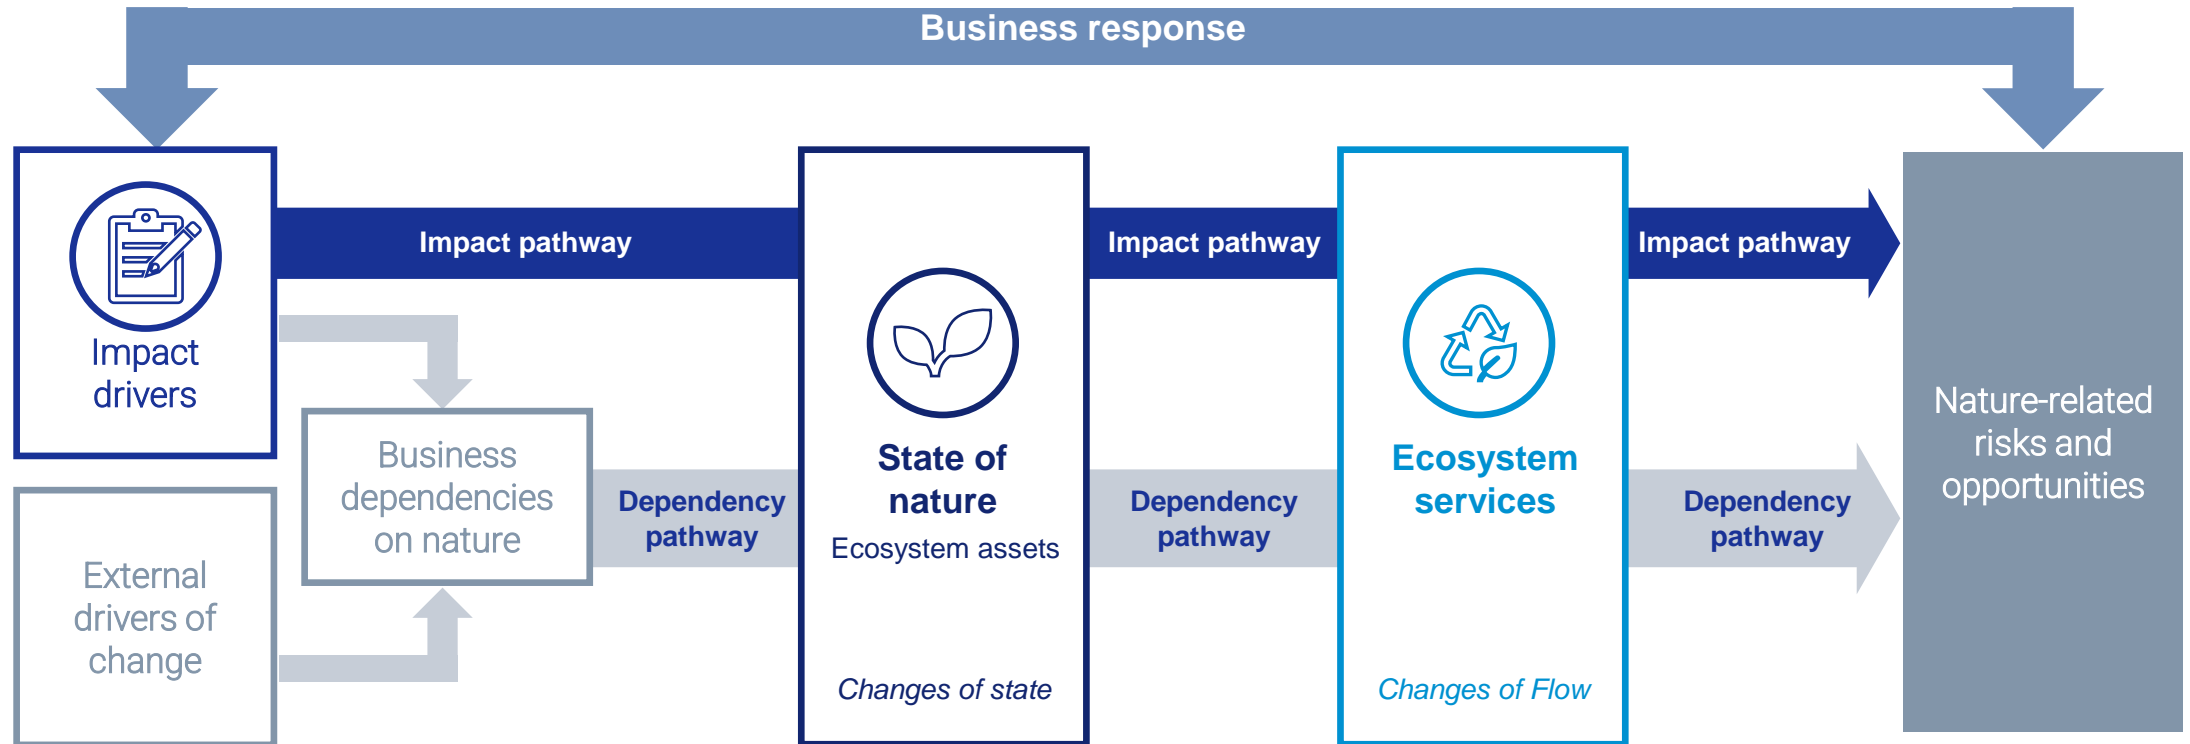

**NGOs** are also **focusing more strongly on** biodiversity, and it is to be expected that biodiversity will be given **greater weight** in **sustainability ratings**

05

The significantly **greater complexity** compared to climate makes it necessary to **deal** with the **topic** in sufficient depth **at an early stage**, even if many framework parameters have not yet been finally defined

# It's key to understand the state of nature & ecosystem services, to determine risks, opportunities & define the responses

Connections between nature-related dependencies, impacts, risks and opportunities

**Impacts:** Changes in the state of nature, which may result in changes to the capacity of nature to provide social and economic functions. Impacts can be positive or negative. They can be the result of an organisation's or another party's actions and can be direct, indirect or cumulative.

**Dependencies:** Aspects of ecosystem services that an organisation or other actor relies on to function.

# The biodiversity-related (financial) risks and their magnitudes are sector dependent

Graph showing the level of risk posed to sectors due to collapse of nature and biodiversity\*

\*Insurance premium data is used to denote the perceived risk per sector

## 5 sectors most affected by biodiversity loss

### Sectors

1. Agriculture, Fishery & Livestock
2. Apparel & Textiles
3. Automotive
4. Chemicals
5. Construction & Engineering
6. Food & Beverages
7. Manufacturing (paper, pulp, timber)
8. Manufacturing (others, e.g. metals)
9. Media & Entertainment
10. Mining & Quarrying
11. Oil & Gas
12. Pharmaceutical, Healthcare, Life Sciences & Biotech
13. Real Estate
14. Telecommunications & IT
15. Tourism, Travel & Hospitality
16. Transportation & Storage
17. Utilities (electricity, energy, water)

Global Property and Casualty Insurance Premium (2019)

- > US\$50 billion
- US\$30–50 billion
- US\$10–30 billion
- < US\$10 billion

**Agriculture, Fishery & Livestock** 1

**Tourism, Travel & Hospitality** 15

**Food & Beverages** 6

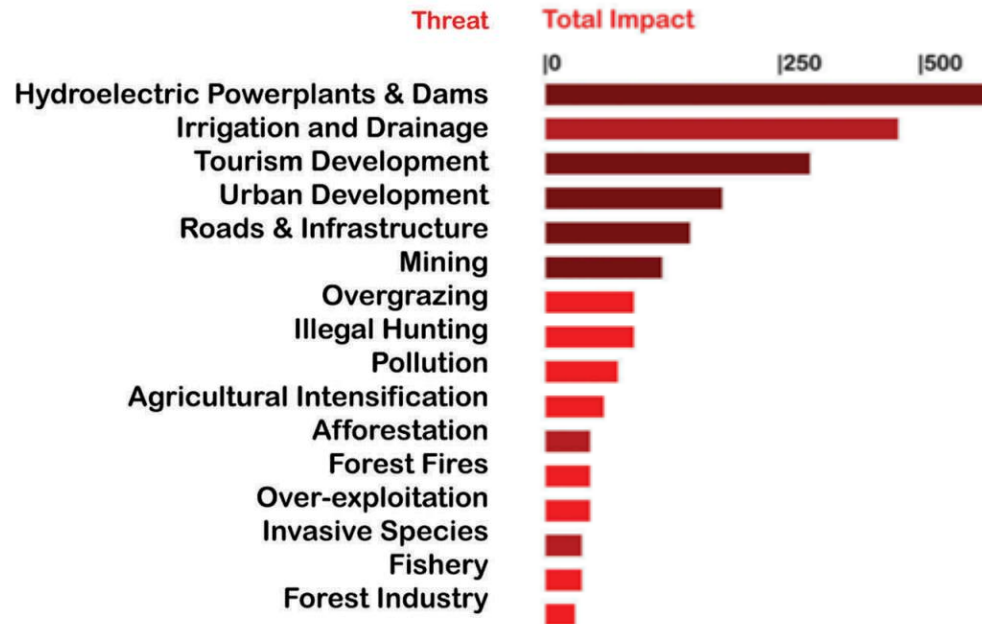

**Manufacturing (paper, pulp, timber)** 7

**Utilities (electricity, energy, water)** 17

# Assessing impacts on biodiversity is location and industry specific

## Industrial activity impact

### Impact Magnitudes:

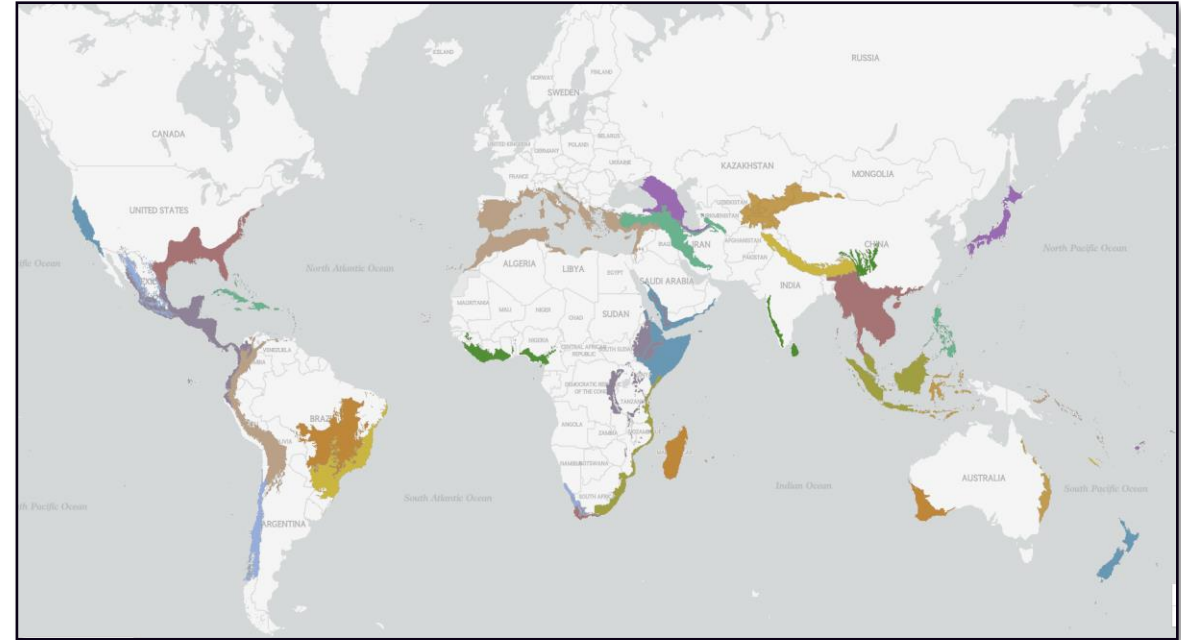

- 1 Reversible Threats
- 2 Threats with a reversible impact through habitat restoration
- 3 Threats with a irreversible impacts

*\*\*Overall impact is measured by multiplying impact scores (from one to three, based on ability of area to return to original state and effort required for restoration) by the number of KBAs affected by a given threat.*

**Globally, there are 36 biodiversity hotspots – extraordinary places that harbour vast numbers of plants and animals found nowhere else**

**A biodiversity hotspot is defined as a region with significant levels of biodiversity that is threatened with destruction.**

*To qualify as a hotspot, a region must meet two criteria:*

- it must contain **at least 1,500 species** of vascular plants (> 0.5 percent of the world's total) as endemics,
- and it must have **lost at least 70%** of its primary vegetation.

# The complexity of the topic creates challenges to be overcome

## High complexity of content

- Very **complex cause-effect relationships** with a **strongly location-dependent view** of impact drivers - **no "global metric"** a la CO<sub>2</sub>e available as in the climate context
- During implementation, **conflicts of objectives** within the **biodiversity drivers** are unavoidable and must be managed

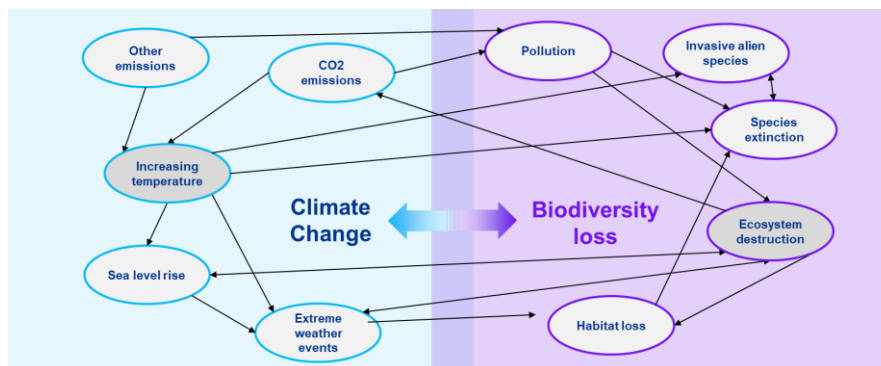

## Commercial opportunities not obvious

- The **breadth** and **depth of commercial opportunities** in the area of **biodiversity** is not immediately tangible
- The **biodiversity** product landscape is heterogeneous - without really **high-volume products** on the active side

## Lack of standards, methods & data

- Well over **100 methods and tools** that address different aspects of biodiversity - **without clear standards** on the market
- High **granularity** of the required data with a simultaneous **lack of data availability** both in-house and externally
- Unclear view of **detailed expectations** and **timing of regulators and politicians** in the financial industry

# Several key frameworks, initiatives and regulations are emerging to support corporate actions

International goals

Disclosure standards & frameworks

SCIENCE BASED TARGETS NETWORK  
GLOBAL COMMONS ALLIANCE

It's Now  
for Nature

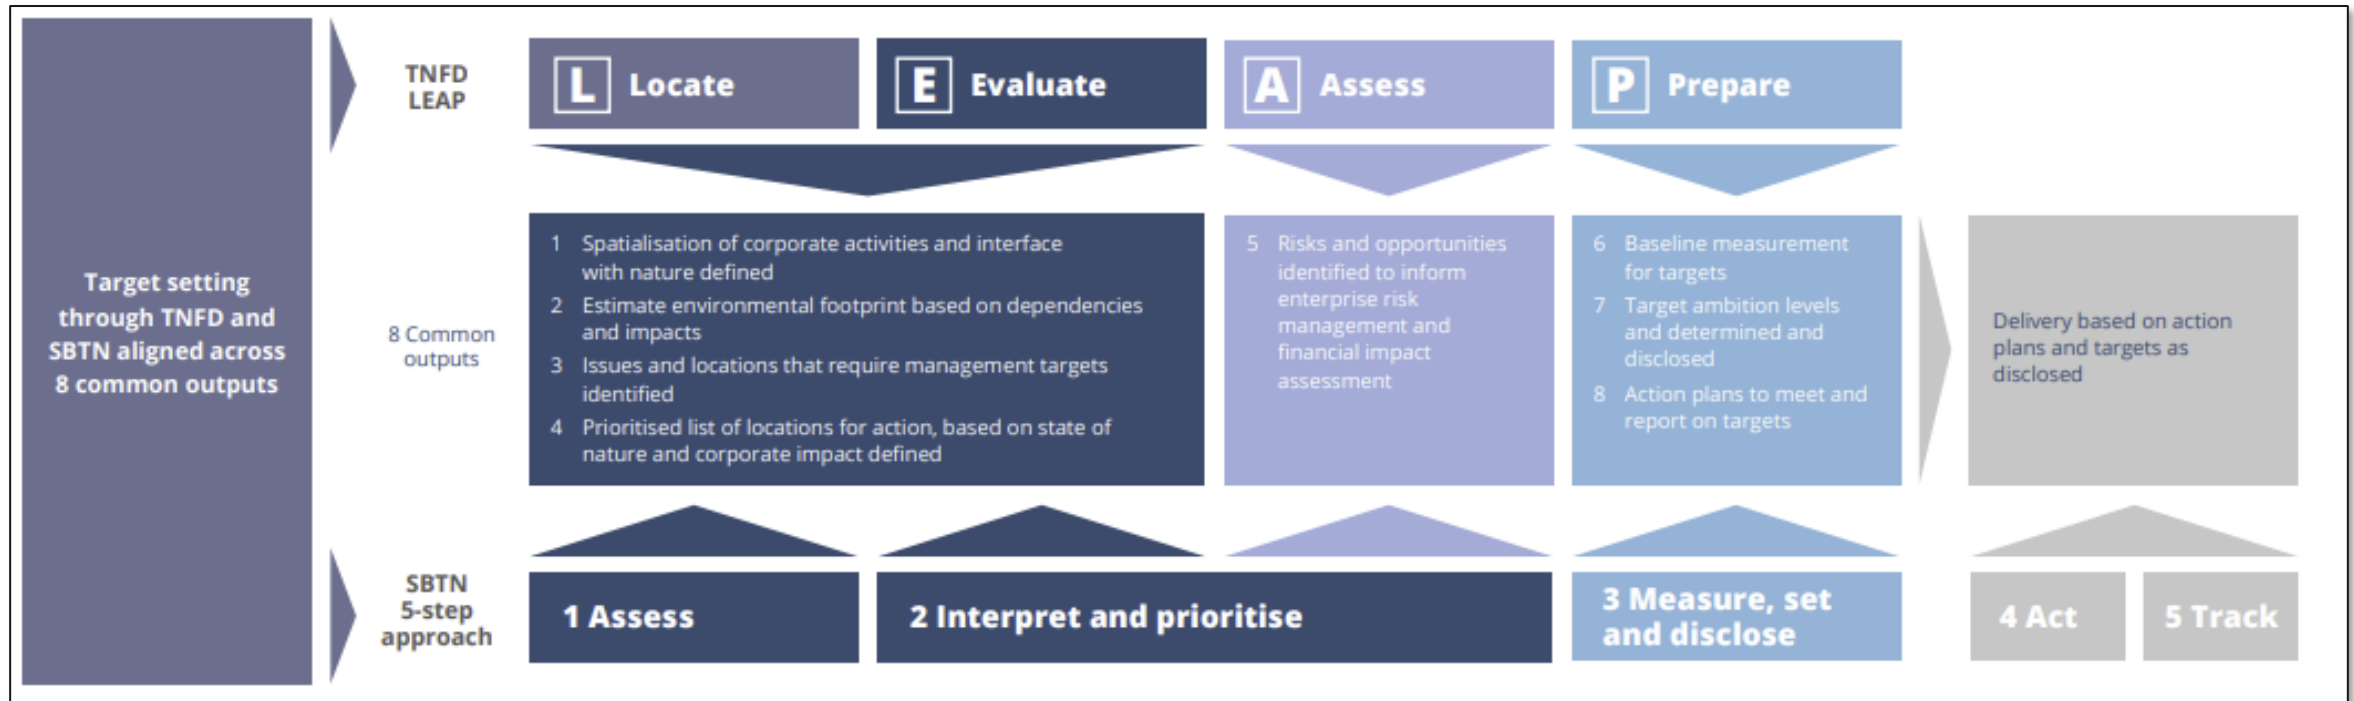

Environmental regulations

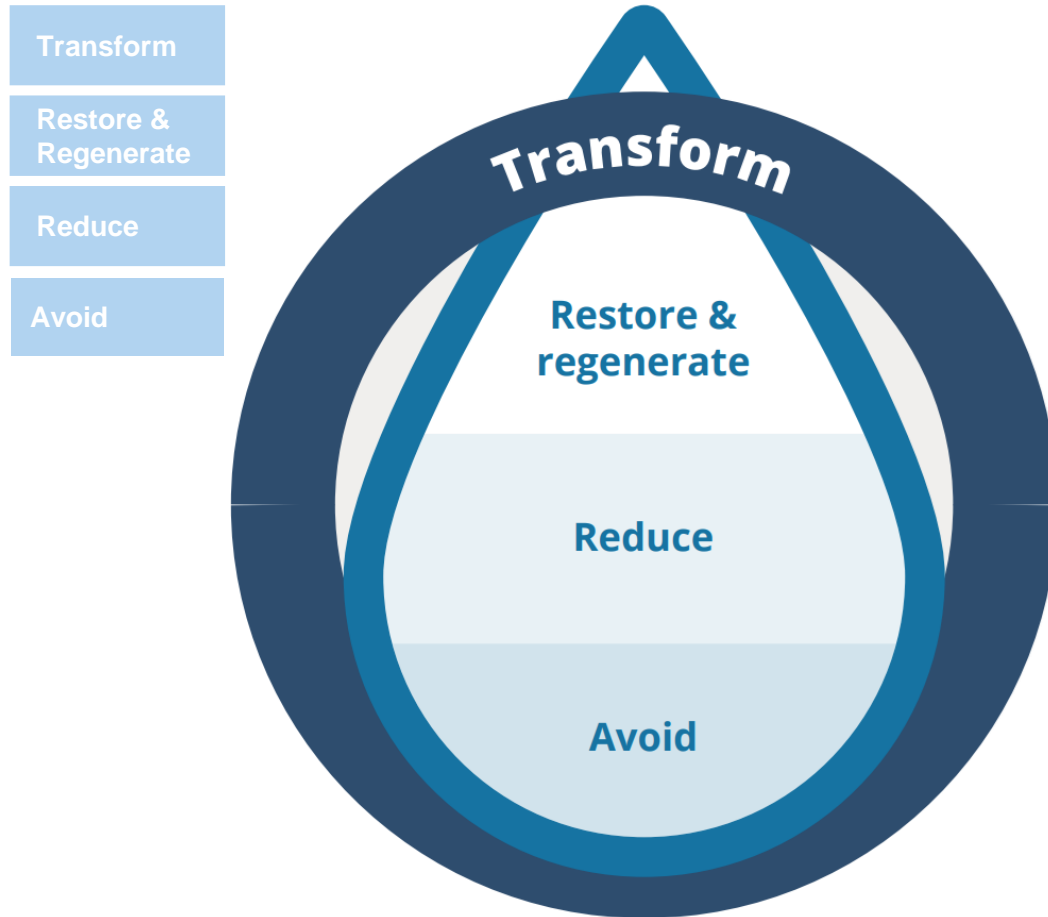

Global networks & alliances

# The TNFD and SBTN are complementary throughout their approaches

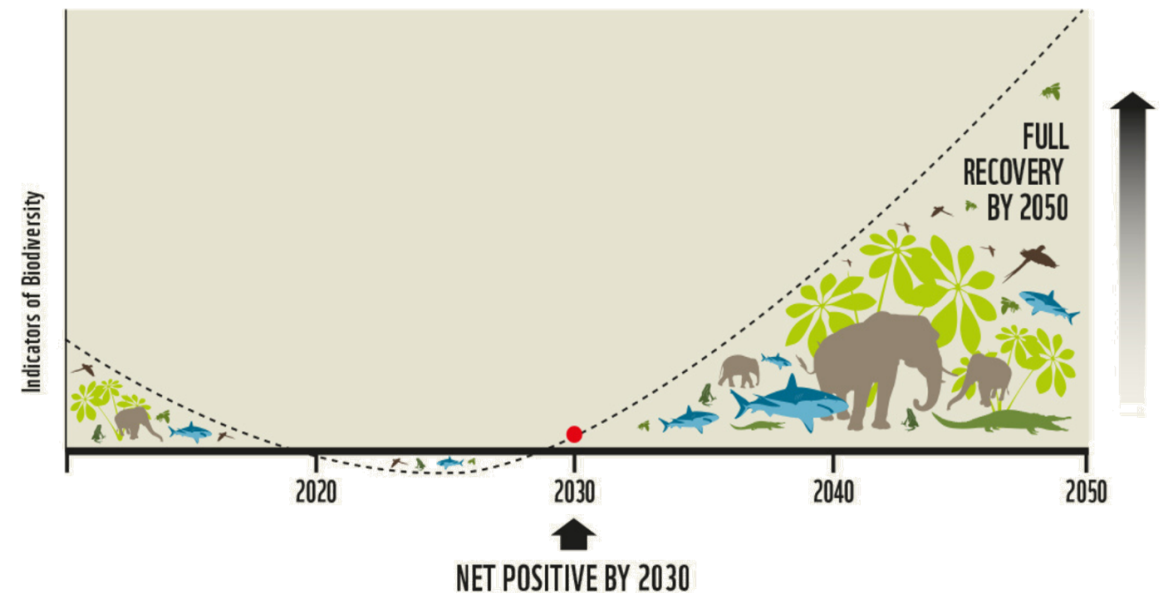

# Companies use the mitigation hierarchy to limit the negative impacts on biodiversity and ecosystem services

Actions ideally go beyond risk reduction and contribute to a nature positive future by influencing the threats and pressures driving nature loss

## Nature Positive by 2030

# Example from construction materials industry - Avoid

Transform

Restore &  
Regenerate

Reduce

Avoid

Ultratech cements- Aditya Birla group

India

## Description

Ultratech is adopting a No Net loss Biodiversity policy and has launched a Biodiversity Management Plan

## Efforts/Performance

- Developed biodiversity assessment tool and identified high biodiversity hotspots around the sites
- Conducted biodiversity assessments on 12 plants all over the India
- Monitored the ecological evolution on its sites

## Achievements

- Selected sites which do fall under key biodiversity area within about 10 kms of radius

# Example from automotive industry – Reduce

Transform

Restore &  
Regenerate

Reduce

Avoid

**BMW  
GROUP** BMW Group

Indonesia

## Description

Along with partners including Pirelli, BMW is working towards reduce its impact on biodiversity by sourcing rubber sustainably

## Efforts/ Performance

- Direct monitoring and checks on the forest area, with the use of satellite and drone-based technology, and a census of the animals at the highest risk of extinction
- Working closely with local communities and NGOs
- Publication of sustainable rubber commitment policy

## Achievements

- Seeks to ensure the conservation of an area of around 2,700 hectares based on a deforestation-free arrangement
- Protection of animals at risk of extinction
- Previously involved with sustainable tire manufacturing and use

# Example from energy industry – Restore & Regenerate

Transform

Restore &  
Regenerate

Reduce

Avoid

Engie

France

## Description

Engie has adopted proactive policies to conserve, restore and regenerate the biodiversity

## Efforts/ Performance

- Implementation of avoidance, reduce and offset flow of work for every project undertaken
- Identified 10 projects for implementing nature-based solutions
- 50 percent sites targeted for Ecological site management to restore in its pristine form
- Selecting biodiversity hotspots
- Greening the supply chain operations to avoid the emissions and subsequently the loss

## Achievements

- Replanted agroforestry trees on 18 hectares of land in 2016
- Commitment to several coalitions which includes Act4 nature, UNESCO, WBCSD
- Species diversity grew 10 folds in the area

# Example from F&B industry – Transform

Transform

Danone

Restore &  
Regenerate

Global

Reduce

Avoid

## Description

Danone addresses biodiversity loss and promote sustainability within its industry through partnerships and innovation

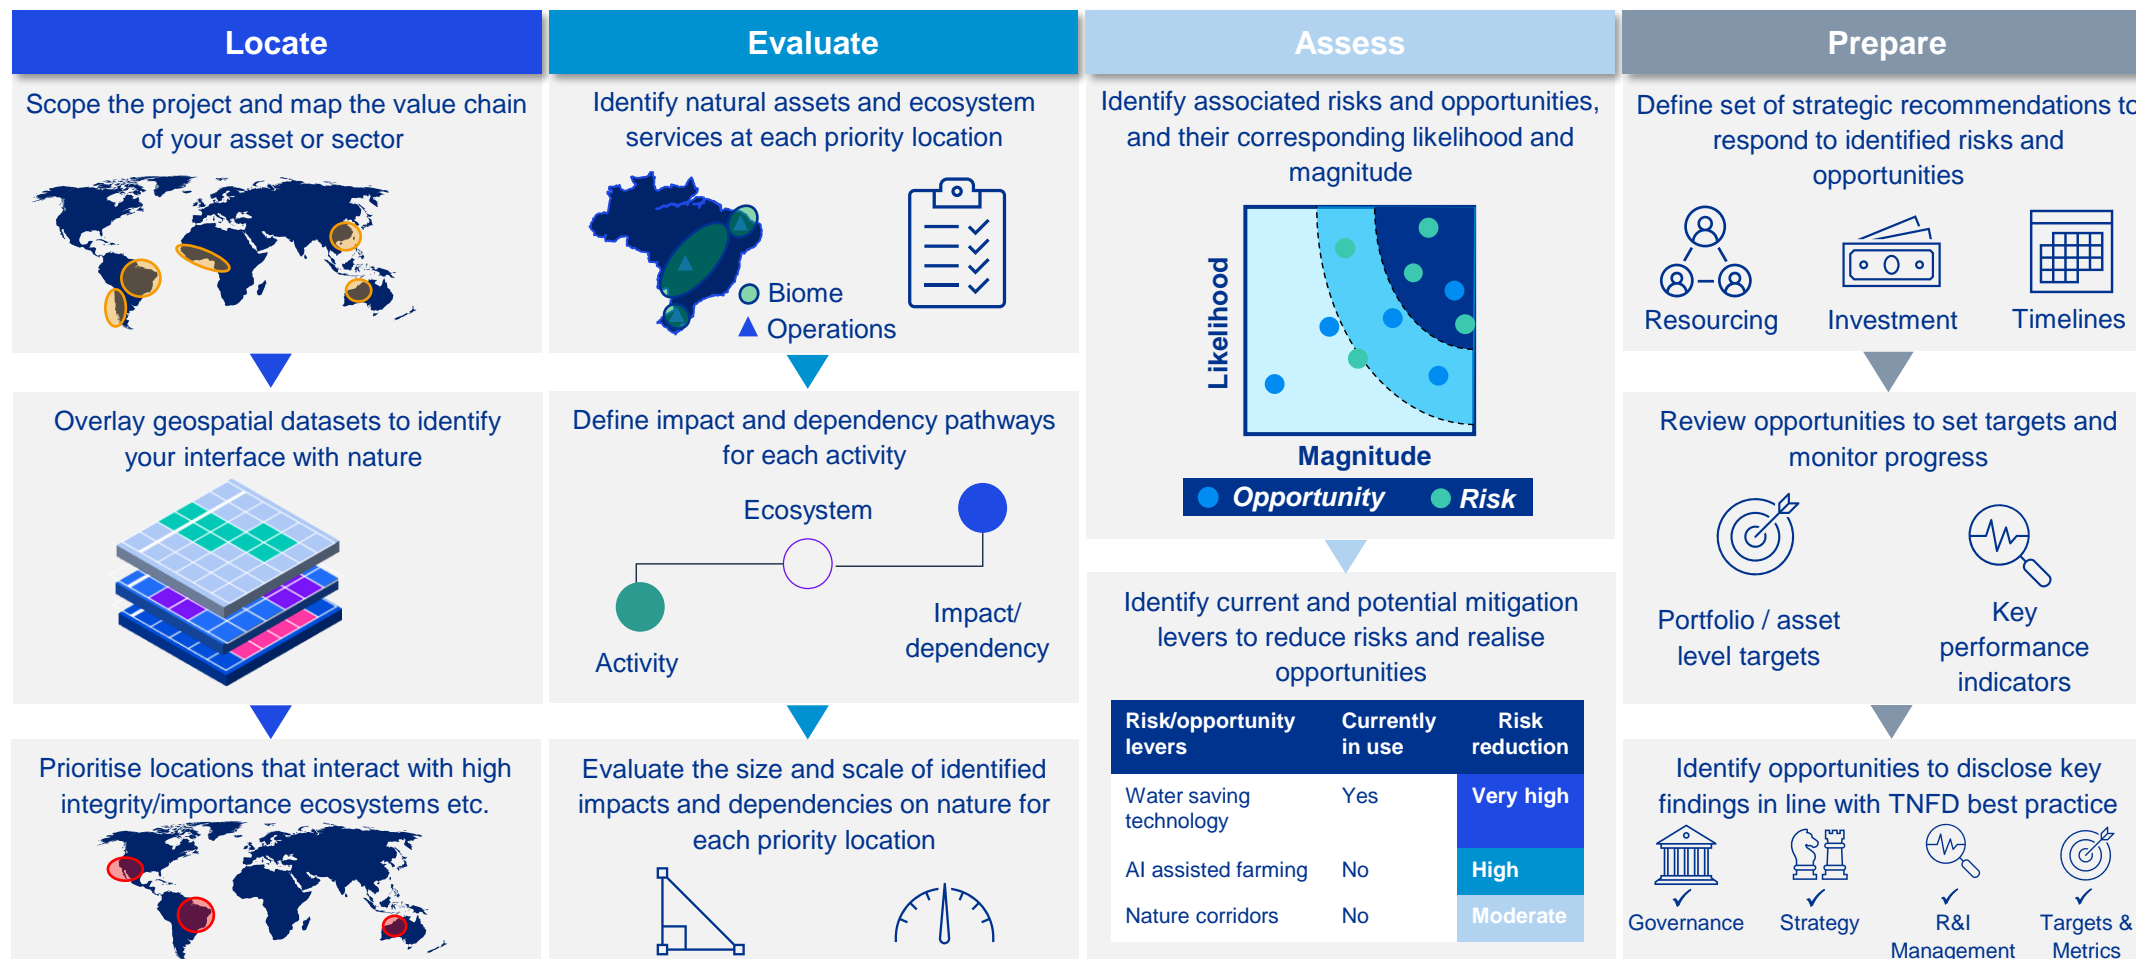

## Efforts/ Performance

- Farming for Generations programme promoting regenerative agriculture practices among its dairy and crop suppliers
- Collaborations with WWF, researchers and experts to build methodologies to promote regenerative agriculture

## Achievements

- Close relationships with over 58,000 farmers worldwide, promoting regenerative agriculture
- Regenerative agriculture helped increase yield, reduce emissions and improve biodiversity
- Created a Regenerative Agriculture Scorecard and Handbook along with experts

# A suite of approaches, data and tools is needed to assess and manage nature-related pressures and dependencies

# The landscape of tools & data is opaque - no "one-fits-all solutions"

### KPMG Classification of the tool landscape

## ENCORE: Exploring Natural Capital Opportunities, Risks and Exposure

**EPI: Yale Environmental Performance Indicator**

**WWF BRF:** WWF Biodiversity Risk Filter

**EXIOBASE:** A global (multi-regional) Environmentally Extended Supply-and-Use / Input-Output database

**GIST Impact:** A suite of tools for financial institutions leveraging impact data using Life cycle impact assessment (LCIA)

**GLOBIO:** Model that calculates local terrestrial biodiversity intactness, expressed by the mean species abundance (MSA)

indicator, as a function of six human pressures

**ReCiPe:** Life cycle impact assessment (LCIA) that translates emissions and resource extractions into environmental impact

scores

## Sector Screening

**ENCORE:** Assessment of dependencies and pressures of sectors in the portfolio (and their supply chains). ENCORE provides insights into dependencies and pressures for 271 economic activities catalogued by ISIC.

**SBTN Materiality Tool:** Materiality screening for direct operations and upstream activities.

Sector scores incl. supply chain

## Country Screening

**EPI:** Locate impacts based on environmental performance indicators for of each country in the portfolio.

**WWF BRF + MSCI:** Identify potential risks based on the condition of ecosystems for each country in the portfolio.

## Country scores

## Financial quantitative analysis – modeling biodiversity footprint

**EXIOBASE, GIST Impact:** Estimated overview of resources used in the supply chain

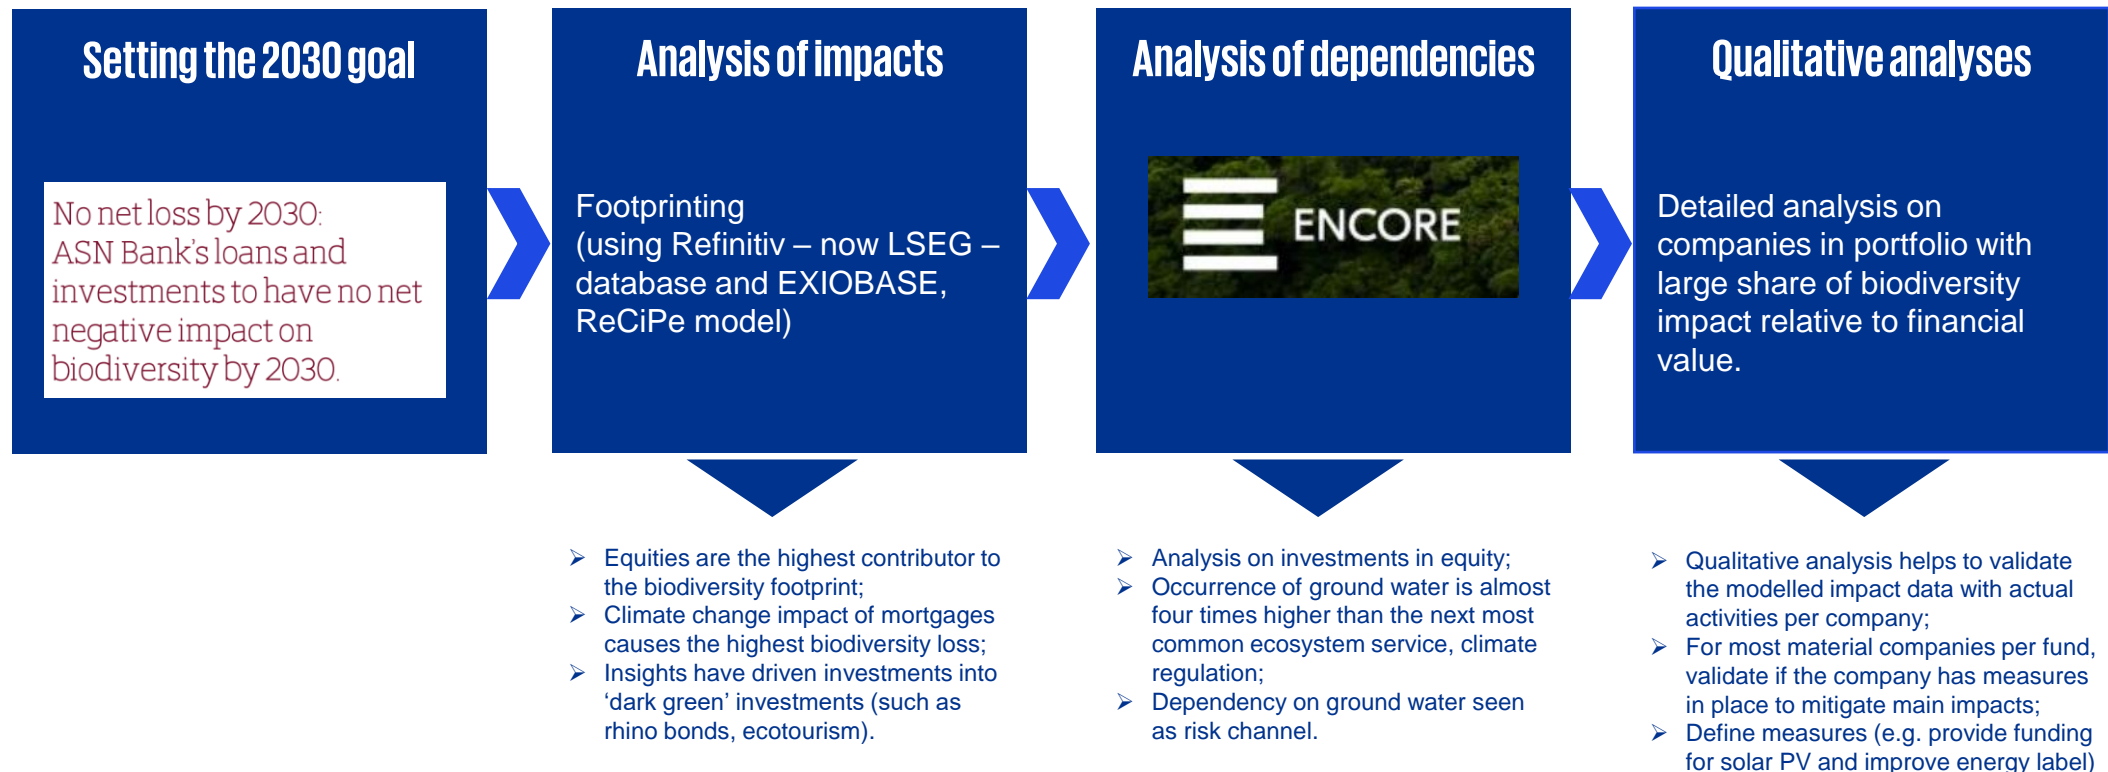

**GLOBIO, ReCiPe:** Modeled footprint data based on pressure-impact data

# Good practice: Moving from nature risk to strategy and targets

ASN bank has set themselves an ambitious goal: no net biodiversity loss by 2030.

As a result, the necessity of deeper insights into their footprint emerged: How do current loans and investments impact biodiversity?

# In summary.....

- Biodiversity **cannot** be measured using a central **indicator** - **metrics** differ depending on the **sub-topic** (e.g. environmental pollution vs. deforestation)
- There are a **large number of different methods, tools** and **databases** available on the market that cover various sub-topics in **different depths of content**
- In addition to the **identification of dependencies**, it is always relevant to take a strongly **location-** and value **chain-dependent approach**
- Depending on the **portfolio**, **different** approaches are therefore required for the assessment of biodiversity impacts; there are **no "one-fits-all solutions"**
- In practice, market pioneers use **specific combinations** of methods, tools & data, according to **individual fit** to their portfolios and use cases
